

CDA3100: Computer Organization

Assignment 05

Assigned: 02/26/15 Due: 03/22/15

Problems From the Textbook (Graded)

3.14. $(3 \times 8) \times 4 \text{tu} = 96$ time units for the hardware and $(4 \times 8) \times 4 \text{tu} = 128$ time units for the software

3.15. 8 bits wide, it requires 7 adders so $7 \times 4 \text{tu} = 28$ time units.

3.16. 8 bits wide, it requires 7 adders in 3 levels so $3 \times 4 \text{tu} = 12$ time units

Additional Problems (Graded)

1. Use Boolean algebra to find the minimum cost SOP expression for the function below. (2)

$$f(a, b, c, d) = a\bar{b}c + cd + \bar{a}d + bd$$

$$f = ab\bar{c} + cd + a\bar{d} + bd$$

$$f = acb\bar{c} + cd + a\bar{d} = acb\bar{c} + a\bar{d} + bd \quad \text{\#using consensus}$$

$$f = ab\bar{c} + a\bar{d}$$

2. Use Boolean algebra to find the minimum cost POS expression for the function below. (2)

$$f(a, b, c, d, e) = \prod M(0, 8, 9, 13, 14)$$

$$f = (a+b+c+d+e)(a+\bar{b}+c+d+e)(a+\bar{b}+c+d+\bar{e})(a+\bar{b}+\bar{c}+d+\bar{e})(a+\bar{b}+\bar{c}+\bar{d}+e)$$

$$f = [(a+c+d+e)+\bar{b}][(\bar{a}+c+d+e)+\bar{b}][(\bar{a}+\bar{b}+d+\bar{e})+c][(\bar{a}+\bar{b}+d+\bar{e})+\bar{c}]$$

$$f = (a+c+d+e)(\bar{a}+\bar{b}+d+e)(\bar{a}+\bar{b}+\bar{c}+\bar{d}+e)$$

3. Answer the following questions using the circuit in Figure 1.

a) Derive the truth table for the circuit in Figure 1. (1)

A	B	C	D	F
0	0	0	0	1
0	0	0	1	0
0	0	1	0	1
0	0	1	1	1
0	1	0	0	1
0	1	0	1	0
0	1	1	0	1
0	1	1	1	0
1	0	0	0	1
1	0	0	1	0
1	0	1	0	1
1	0	1	1	0
1	1	0	0	1
1	1	0	1	0
1	1	1	0	1
1	1	1	1	0

b) Derive the Boolean expression from the truth table (not simplified). (1)

$$f = (a + !b)(!cb) + d$$

c) Redesign the circuit so that it only uses two-input NAND gates. (4)

4. Show how to implement the function below using a 3:8 decoder and an OR gate. (2) $f(a, b, c) = \sum m(0, 2, 3, 4, 5, 7)$

5. Assume that the integers are unsigned. You must perform the operation in binary and show your work. Use ten bits of precision and state whether there was an overflow – justify your answer. (2)

$$188 + 371 = 551$$

$$188 = 010111100$$

$$371 = 101110011$$

1111 (carry overs)

$$010111100$$

$$+ \quad \underline{101110011}$$

$$= 1000101111$$

- No overflow because the most significant bit did not carry over using 10 bits of precision.

6. Assume that the integers are signed, 2's complement. You must perform the operation in binary and show your work. Use ten bits of precision and state whether there was an overflow – justify your answer. (2)

$$188 - 371$$

$$188 = 10111100$$

$$371 = 101110011$$

$$10111100$$

$$- \quad \underline{101110011}$$

$$= 1101001001$$

No overflow because 0 XOR with 1 gives you zero.

7. Assume that the integers are unsigned. You must perform the operation in binary and show your work. Use sixteen bits of precision. (2)

$$188 \times 64$$

$$0000\ 0000\ 1011\ 1100$$

$$\underline{\times 0000\ 0000\ 0100\ 0000}$$

$$= 0010\ 1111\ 0000\ 0000$$

- Simply left shifted the multiplicand by 6 and filled with zeros.

8. Assume that the integers are unsigned. You must use hexadecimal arithmetic. Determine the result in hex, octal, and binary. (2)

$$6A94 + 5AB1$$

$$\text{Hex} = C545$$

$$\text{Binary of } C545 = 1100\ 0101\ 0100\ 0101$$

$$\text{Oct} = 1\ 100\ 010\ 101\ 000\ 101$$

$$= 142505$$

9. Show how to divide 371 by 8 using unsigned binary division. Show the remainder, if there is one. (2)

$$1000 / 101110011$$

$$1000 \mid 101110011$$

$$\begin{array}{r} \underline{+1000} \end{array}$$

$$00111$$

$$\begin{array}{r} \underline{+0000} \end{array}$$

$$1110$$

$$\begin{array}{r} \underline{+1000} \end{array}$$

$$01100$$

$$\begin{array}{r} \underline{+1000} \end{array}$$

$$01001$$

$$\begin{array}{r} \underline{+1000} \end{array}$$

$$\text{Remainder} = 11(3)$$

Answer: xxx101110 R.11

10. Show how to perform the operation $(6 * 9)$ using the optimized multiplier discussed in class. Assume the operands are 5b instead of 32b (be sure that you adjust all of the registers appropriately). You must show each step, from initialization to the final product. (8)

0110 * 1001

<u>Product</u>	<u>Mult</u>
<u>00000 01001</u>	<u>00110</u>
<u>00110 01001</u>	<u>00110</u>
<u>00011 00100</u>	<u>00110</u>
<u>00001 1010</u>	<u>00110</u>
<u>00000 10010</u>	<u>00110</u>
<u>00110 11001</u>	<u>00110</u>
<u>00011 01100</u>	<u>00110</u>
<u>00001 10110</u>	<u>00110</u>

11. Show how to perform the operation $(-6 * 9)$ using Booth's algorithm. Assume the operands are 5b instead of 32b (be sure that you adjust all of the registers appropriately). You must show each step, from initialization to the final product. (8)

<u>Product</u>	<u>Multiplicand</u>
<u>00000 01001</u>	<u>11010</u>
<u>00110 01001</u>	
<u>00011 00100</u>	
<u>11101 00100</u>	
<u>11110 10010</u>
